

Wait for another 3-5s and then press the "Enter" / "Return" key.

6. Next, run the following command to boot the application that you'd just downloaded:

boot flash0.app0

You should see your application run (hopefully!) and see LED(s) blink if the default test app has been used.

7. To exit the application, you'll have to hard-reset the microcontroller to reboot the same (and greet you with the DragonBoot console once again!). 8. Feel free to play around with other commands implemented on DragonBoot, you can get a full list of the same along with their syntax by simply typing the below

command on the DragonBoot console:

help

Also, you can use the TAB auto-complete feature to help you with the syntax of the commands implemented for the console.

For additional details, take a look at the document "docs/DragonBoot\_UserGuide.pdf".

Cheers, have fun!
